Name of Student: Rikisha Bhattacharya	**PRN: 25070122155**
Semester: III	**Year: AY 2026-27**
Subject: Programming with Java	
ASSIGNMENT No: 23	
TITLE: JDBC ResultSet	

Problem Statement

Develop a Java application using JDBC to navigate and retrieve records from a ResultSet.

Learning Objectives

To navigate and retrieve records using ResultSet methods.

1. **Create a program to display database records one by one using ResultSet.**
2. **Create a Java program that retrieves employee records from a database and displays them one by one using ResultSet. Show employee ID, name, department, and salary sequentially.**

Programme

Welcome | HospitalLoginApp.java | ResultSetNavigationDemo.java

ResultSetNavigationDemo.java > ResultSetNavigationDemo > main(String[])

```java
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.ResultSet;
import java.sql.Statement;

public class ResultSetNavigationDemo {
    Run | Debug
    public static void main(String[] args) {
        String url = "jdbc:mysql://localhost:3306/rikishab";
        String user = "root";
        String password = "YourNewPassword123!";

        String query = "SELECT emp_id, name, department, salary FROM employees_nav";

        try (Connection conn = DriverManager.getConnection(url, user, password);
             Statement stmt = conn.createStatement(ResultSet.TYPE_SCROLL_INSENSITIVE, ResultSet.CONCUR_READ_ONLY);
             ResultSet rs = stmt.executeQuery(query)) {

            System.out.println(x: "--- Navigating Employee Records One by One ---");

            int count = 1;
            while (rs.next()) {
                System.out.println("\nRecord " + count + ":");
                System.out.println("Employee ID : " + rs.getInt(columnLabel: "emp_id"));
                System.out.println("Name        : " + rs.getString(columnLabel: "name"));
                System.out.println("Department  : " + rs.getString(columnLabel: "department"));
                System.out.println("Salary      : $" + rs.getDouble(columnLabel: "salary"));
                count++;
            }

        } catch (Exception e) {
            e.printStackTrace();
        }
    }
}
```

Output

Conclusion:

Thus, the JDBC ResultSet was used to retrieve and display database records sequentially. This assignment helped in understanding how to navigate query results and access individual fields, such as employee ID, name, department, and salary, using JDBC
